

INSTALLATION INSTRUCTIONS

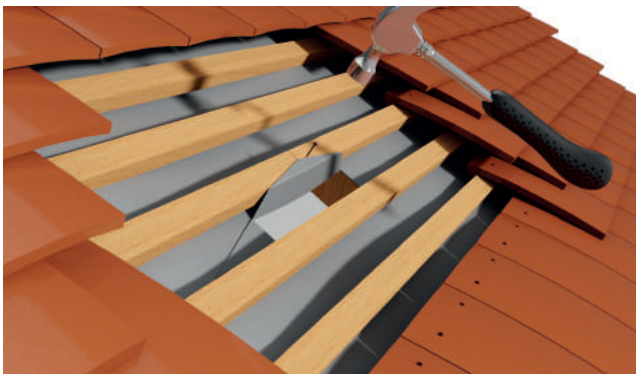

1. Locate the position of the vent in the roof, ensuring that the location is clear of the rafters below.

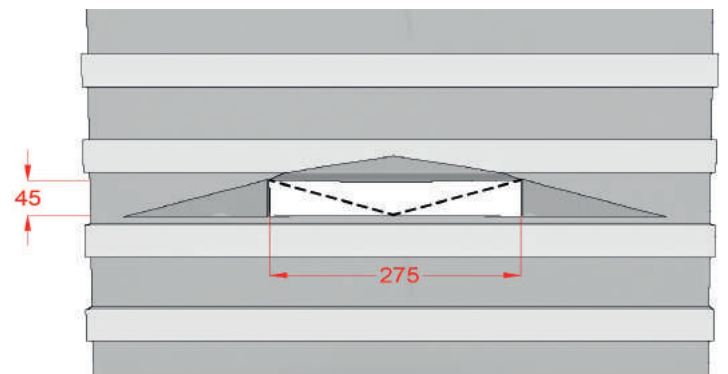

2. Once the position of the vent has been determined, mark and cut the underlay in a V-shape to the size shown below.

For a fully boarded roof, a corresponding hole should also be cut in the sarking board.

3. The top and side underlay triangular shapes should be folded outward and underneath the ventilator. The top triangle should be tacked to the batten above.

Underlay cutting

It is important that the cut forms a snug fit to the ventilator to deflect and prevent water and debris penetration through the underlay.

4. Position the vent with the spigot through the underlay cut and nail the ventilator to the batten through the hole in the top flange.

5. With the ventilator in position, tiling can be completed, leaving a discreet flush fitting installation.

SOIL PIPE AND EXTRACTOR CONNECTION

The vent must be accessed from the underside. Fit the Pipe Adapter (code HD DPCA) over the spigot on the underside of the vent and fix the adapter into the battens using the screws provided.

The adapter can be supplied alone or with the Flexi Pipe Connector attached as a kit (code HD DPCSPA).
